

### Before meeting

- Wrote working scala code for nearest neighbour, limited to scaling by integer value in width and height
- Looking to set goals for next meeting

### In meeting

- Goal: Rewrite NN to use lift primitives
- Can play around and generate C, OpenCL, and OpenMP code and have a look at how it works.
- Will need to use padclamp and split join functions to emulate the functionality of the generate array function that was used in my scala code, no such feature in lift yet.
